

Getting Styles From Other Drawings In Autocad Civil 3D

written by Nirmal Raj Joshi | September 21, 2024

In the world of design and drafting, maintaining consistency across multiple drawings is essential for clarity and professionalism. Styles—such as line types, colors, and text formats—play a crucial role in how information is conveyed.

There are several ways to import styles from other drawings:

Method 1 : From toolspace

Open both drawings and navigate to **Toolspace > Settings**. Select the drawing where you want to apply the styles (the target drawing). Then, drag the settings from the source drawing into the target drawing.

Method 2: Using command line to pull style from another drawing

Use the `_AttachReferenceTemplate` command to import styles from another drawing.
